Our caching, streaming and download services bring your users immediate worldwide access no matter where they're based. The services are powered by patented content routing technology and extensive capabilities developed through our partnership with the world's first CDN (Content Delivery Network). We're ahead of the game but we won't blind you with science. We'll give you honest, unbiased advice so you can gain the advantage by specifying the services you need now and understanding the upgrade path for your business as it develops.

Caching, streaming and download services provide network scalability, global coverage and superior performance while alleviating the need to invest in costly web hosting infrastructure. We use Level 3 caching and download services that use the Level 3's IP backbone to achieve domestic and international coverage for you. We provide industry leading performance and availability across a network of thousands of carrier class edge servers thereby ensuring your content can be reliably, speedily and effectively served to your end users.

What's on offer?

Capacity on demand

adapt's CDN capability proactively monitors resources to meet the usage demands you place on your web operations. Flexible capacity enables cost efficiency in operation while reducing the cost of managing your website and improving performance.

Global coverage

Having server clusters in strategic locations in North America, Europe and Asia ensures top performance to destinations across the globe. With excellent global connectivity, you can count on **adapt** to serve your content close to your end user.

Scalability

adapt's CDN has the capacity to handle content delivery even during peak loads and flash events that require extra bandwidth to accommodate growing libraries of content and audiences of any size.

Online management portal

A web based management portal allows you to receive historical usage reporting and real time usage monitoring. Usage logs are available to you via an automated download tool and real time invalidation of content can be controlled through portal or scriptable interface.
